

PAINTING STUDY MATERIAL FOR CLASS 11TH BASED ON NCERT

RADHA KISHOR MONDAL Date : 31/08/20

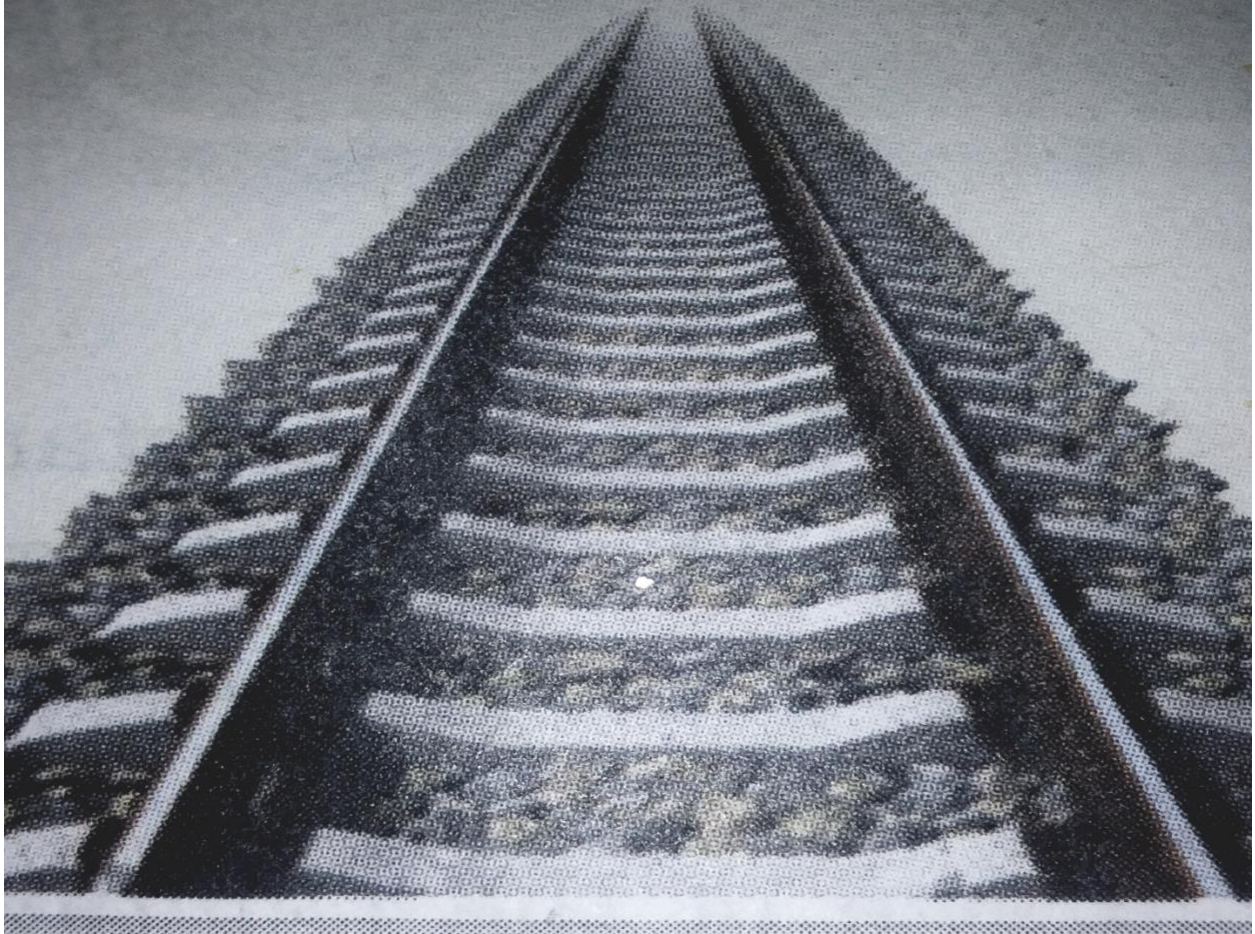

Perspective :

Same object is observed differently if it is on the eye level and below the eye level, as shown in this picture.

Same object is observed big in size with detail when it is near to us and it looks small in size when it is far. For example, distance between two lines of railway track is equal everywhere but our eyes observed them that they meet together at far distance; as shown in the following picture.

Far

Near
