## STRATEGIES FOR ENHANCEMENT IN FOOD PRODUCTION

Poultry Farm Management- poultry is the class of domesticated birds used for food or for their eggs. It mainly includes chicken and ducks and with turkey and geese. Important

components of poultry farm management includes-

- o Selection of disease free and suitable breeds.
- o Proper and safe farm condition.
- o Proper feed and water
- o Hygiene and health care

Animal Breeding – It aims at increasing yields of animals and improving the desirable

qualities of the product. A breed is a group of animals related by descent and similar in most

of characters like general appearance, features, size, configuration etc. There are two kinds

of breeding

**Inbreeding** – breeding between animals of same breeds.

**Outbreeding**- crosses between different breeds.

Inbreeding depression - continued inbreeding reduces fertility and even productivity. This is

called Inbreeding Depression. Whenever this becomes a problem, selected animals of the

breeding population should be mated with unrelated superior animals of the same breed.

This usually helps restore fertility and yield.
