ADAPTATION IN ANIMALS

SUBJECT TEACHER-SONI KUMARI

ANIMALS IN DANGER

In spite of so many adaptations , many animals are facing the danger of extinction from the earth .

The reasons for this include diseases , destruction of their habitats and too much of hunting .

Below are given some animals which are officially recognized as endangered animals .

Otter , Lemur , Panda , Armadillo , Cheetah , Flying squirrel , Orangutan , Gorilla .

Animals can be protected in the following ways :

Trees are the natural homes of many animals such as squirrels , monkeys , birds and many wild animals .

Therefore , we should avoid cutting down trees so as to protect their homes .

Things such as leather bags , belts and fur coats are made from animal skin .

We should avoid using such things to protect animals .

Don't write only read it .

E . Answer the following questions :

1 . What kind of bodies do aerial animals have ?

Ans : - Aerial animals have these types of bodies :

Birds have light , hollow and air filled bones which make their body light .

They have feathers and wings that enable them to fly .

Their body is narrow in the front and at the back and is broad from the middle .

This shape helps them to cut through the air and fly easily .
