Forest

A forest is a large area covered with trees, plants, shrubs and bushes.

Forest is a beautiful creation of nature and the dwelling place of animals.

Forests are an important part of the ecosystem as they help in maintaining bio-diversity.

Temperature and rainfall also affect the development of different types of forests.

No forest exists in a desert area, only a few trees can grow, which survives on the groundwater.

A 'Coniferous Forest' is an evergreen forest found in the northern hemisphere.

A 'Deciduous Forest' sheds its leaves every year.

The 'Tropical Rainforest' is a very dense forest consisting of mainly evergreen trees all around the year.

Trees and forests help in purifying the air.

Forests regulate the atmospheric temperature by keeping the environment cool

H.W Write it two times in neat and clean writing
