CLASS VIII (MATHEMATICS)

Question 1. Find the value of P if

$$\left(\frac{2}{5}\right)^3 \times \left(\frac{2}{5}\right)^{-6} = \left(\frac{2}{5}\right)^{2P-1}$$

Solution:

$$\begin{aligned} \left(\frac{2}{5}\right)^3 \times \left(\frac{2}{5}\right)^{-6} &= \left(\frac{2}{5}\right)^{2P-1} \\ \Rightarrow \quad \left(\frac{2}{5}\right)^{3-6} &= \left(\frac{2}{5}\right)^{2P-1} \\ \Rightarrow \quad \left(\frac{2}{5}\right)^{-3} &= \left(\frac{2}{5}\right)^{2P-1} \end{aligned}$$

Equating the powers of the same base

$$\begin{aligned} 2P - 1 &= -3 \\ 2P &= -3 + 1 \\ 2P &= -2 \\ \therefore \quad P &= -1 \end{aligned}$$

Question 12.

If $\left(\frac{x}{y}\right) = \left(\frac{3}{2}\right)^{-2} + \left(\frac{3}{7}\right)^0$, find the value of $\left(\frac{x}{y}\right)^{-3}$.

Solution:

$$\begin{aligned} \left(\frac{x}{y}\right) &= \left(\frac{3^{-2}}{2^{-2}}\right) + 1 & \left[\because \left(\frac{a}{b}\right)^0 = 1 \right] \\ &= \frac{2^2}{3^2} = \frac{4}{9} \\ \therefore \quad \left(\frac{x}{y}\right)^{-3} &= \left(\frac{4}{9}\right)^{-3} \\ &= \frac{4^{-3}}{9^{-3}} = \frac{9^3}{4^3} \\ &= \frac{729}{64} \end{aligned}$$

Question 13.

Find the value of x if

$$1. \quad \left(\frac{125}{27}\right) \times \left(\frac{125}{27}\right)^x = \left(\frac{5}{3}\right)^{18}$$

$$2. \quad (81)^{-4} \div (729)^{2-x} = 9^{4x}$$

Simplify:
$$\frac{(x^{m+n})^2 \times (x^{n+p})^2 \times (x^{p+m})^2}{(x^m \cdot x^n \cdot x^p)^3}$$
