Solve The Following Questions:-

Question No. 1:-----

Prove that a cyclic parallelogram is a rectangle.

Solution:

Given: ABCD is a cyclic parallelogram

To Prove: ABCD is a rectangle

Proof: \therefore ABCD is a cyclic quadrilateral

$\therefore \angle 1 + \angle 2 = 180^\circ \dots(1)$ (\because opposite angles of a cyclic quadrilateral are supplementary)

\therefore ABCD is a parallelogram

$\therefore \angle 1 = \angle 2 \dots(2)$ (\because Opposite angles of a parallelogram)

From equations (1) and (2),

$$\angle 1 = \angle 2 = 90^\circ$$

\therefore Parallelogram ABCD is a rectangle.

Question No.2:-----

If circles are drawn taking two sides of a triangle as diameters, prove that the point of intersection of these circles lie on the third side.

Solution:

Given: Circles are described with sides AB and AC of a triangle ABC as diameters. They intersect in a point D.

To Prove: D lies on the third side BC of ΔABC .

Construction: Join AD.

Proof: Circle described on AB as diameter intersects BC in D.

$\therefore \angle ADB = 90^\circ$ | Angle in a semi-circle

But $\angle ADB + \angle ADC = 180^\circ$ | Linear Pair Axiom

$\angle ADC = 90^\circ$.

Hence, the circle described on AC as diameter must pass through D.

Thus, the two circles intersect in D.

Now, $\angle ADB + \angle ADC = 180^\circ$.

\therefore Points B, D, C are collinear.

\therefore D lies on BC.
