Epithelial Tissue

- They are the protective tissues of the human body. They cover many organs and cavities that are present inside the body.
- **Where are the epithelial tissues found in the human body?**
 - The lining of the blood vessels
 - The lining of the mouth
 - Kidney tubules
 - Skin
 - Lung alveoli
- **Structure and functions of the epithelial tissues -**
 - The main function of the epithelial tissues is to act as a barrier and separate different organs and systems from each other.
 - There is no space between the cells of epithelial tissues
 - The cells are permeable. This makes it possible for them to exchange materials between different parts of the body and also between the body and the external environment.
 - The epithelial tissues remain separated from the tissues beneath them because of a thin membrane over them.
