NUMERICAL PROBLEMS BASED ON MOLE CONCEPT

Question1. Calculate the mass of 6.022×10^{23} molecule of Calcium carbonate (CaCO_3).

Solution1. Molar mass (Molecular mass in gram) of $\text{CaCO}_3 = 40+12+3 \times 16 = 100 \text{ g}$

No. of moles of $\text{CaCO}_3 = \text{No. of molecules}/\text{Avogadro constant}$

$$= 6.022 \times 10^{23} / 6.022 \times 10^{23}$$

$$= 1 \text{ mole}$$

Mass of $\text{CaCO}_3 = \text{No. of moles} \times \text{molar mass}$

$$= 1 \times 100 \text{ g}$$

$$= \mathbf{100 \text{ g.}}$$

Question2. Calculate the mass of 12.044×10^{23} carbon atoms.

Solution2. No. of moles of Carbon atoms = No. of atoms/Avogadro constant

$$= 12.044 \times 10^{23} / 6.022 \times 10^{23}$$

$$= 2 \text{ mole}$$

Mass of carbon atoms = No. of moles \times atomic mass

$$= 2 \times 12$$

$$= \mathbf{24 \text{ g.}}$$

Question3. Calculate the number of oxygen atoms in 1 mole of O_2 .

Solution3. 1 molecule of $\text{O}_2 = 2$ oxygen atoms

So, 1 mole of $\text{O}_2 = 2$ mole oxygen atoms

$$= 2 \times 6.022 \times 10^{23}$$

$$= \mathbf{12.044 \times 10^{23} \text{ oxygen atoms.}}$$

Question4. Calculate the number of Cu atoms in 0.635g of Cu.

Solution4. No. of moles of Cu = Mass of Cu/Atomic mass

$$= 0.635/63.5$$

$$= 0.01 \text{ mole}$$

$$\begin{aligned}
 \text{No. of Cu atoms} &= \text{No. of moles} \times \text{Avogadro constant} \\
 &= 0.01 \times 6.022 \times 10^{23} \\
 &= \mathbf{6.022 \times 10^{23} \text{ Cu atoms.}}
 \end{aligned}$$

Question5. Calculate the number of molecules in 11.2 liters of SO_2 gas at NTP.

Solution5. 1 mole of $\text{SO}_2 = 22.4 \text{ L (at NTP)}$

$$\begin{aligned}
 \Rightarrow 11.4 \text{ L of } \text{SO}_2 &= 0.5 \text{ mole } \text{SO}_2 \\
 &= 0.5 \times 6.022 \times 10^{23} \\
 &= \mathbf{3.011 \times 10^{23} \text{ SO}_2 \text{ molecules.}}
 \end{aligned}$$

Question6. An atom of some element X weighs $6.644 \times 10^{-23} \text{ g}$. Calculate the number of gram-atoms in 40 kg of it.

$$\begin{aligned}
 \text{Solution6. Mass of 1 mole X atoms} &= \text{mass of 1 atom} \times \text{Avogadro constant} \\
 &= 6.644 \times 10^{-23} \times 6.022 \times 10^{23} \\
 &= 40 \text{ g}
 \end{aligned}$$

So, the atomic mass of X = 40

$$\begin{aligned}
 \text{No. of gram-atoms (or moles) of X} &= \text{mass of X} / \text{atomic mass} \\
 &= 40 \times 1000 / 40 \\
 &= \mathbf{1000.}
 \end{aligned}$$

Question7. An atom of some element X weighs $6.644 \times 10^{-23} \text{ g}$. Calculate the number of gram-atoms in 40 kg of it.

Solution7. Molecular mass of $\text{CO}_2 = 12 + 2 \times 16 = 44$

$$\begin{aligned}
 \text{Total no. of moles in 200mg } \text{CO}_2 &= \text{Mass of } \text{CO}_2 / \text{Molecular mass} \\
 &= 200 \times 10^{-3} \text{ g} / 44 \\
 &= 0.00454
 \end{aligned}$$

$$\begin{aligned}
 \text{No. of moles removed} &= 10^{21} / 6.022 \times 10^{23} \\
 &= 0.00166
 \end{aligned}$$

$$\begin{aligned}
 \text{No. of moles of } \text{CO}_2 \text{ left} &= 0.00454 - 0.00166 \\
 &= \mathbf{0.00288.}
 \end{aligned}$$

Question8. Calculate the volume occupied by 1 mole atom of

(i) Monoatomic gas, and (ii) Diatomic gas at NTP.

Solution8. 1 mole atom of monoatomic gas occupies 22.4 L at NTP, and
1 mole of diatomic gas (contains 2 atoms) occupies 11.4 L at NTP.

Question9. Calculate the volume of 20g H₂ at NTP.

Solution9. No. of moles of H₂ = 20/2 = 10

$$\begin{aligned}\text{Volume of any ideal gas at NTP} &= \text{No. of moles} \times 22.4 \text{ L} \\ &= 10 \times 22.4 \\ &= \mathbf{224 \text{ L.}}\end{aligned}$$

Question10. What is the volume occupied by 6.022×10^{23} molecules of any gas at NTP?

Solution10. 6.022×10^{23} molecules = 1 mole molecules, and

1 mole molecules of any ideal gas occupies 22.4 L at NTP.

Question11. Calculate the number of atoms in 5.6 liters of a

(i) Monoatomic, and (ii) diatomic gas at NTP.

Solution11. No. of moles in 5.6 L gas at NTP = 5.6/22.4 = 0.25

$$\begin{aligned}\text{No. of molecules in 5.6 L gas} &= 0.25 \times 6.022 \times 10^{23} \\ &= 1.5 \times 10^{23} \text{ molecules}\end{aligned}$$

(i) In monoatomic gases, No. of atoms = No. of molecules

$$= \mathbf{1.5 \times 10^{23} .}$$

(ii) In diatomic gases, No. of atoms = 2 × No. of molecules

$$= 2 \times 1.5 \times 10^{23}$$

$$= \mathbf{3.0 \times 10^{23} .}$$
