

Ch.EVELUTION OF LAND FORM

RIVER TERRACES

Marking old valley floor

They represent flood plain levels

They may consist of stream deposits

They are formed due to verticals erosion

There may be number of formal floodplains

If they are at the same level they are called paired terraces

If they are found at different levels they are called non paired terraces

Unpaired terraces are found in the areas of slow upliftment areas Reasons for the formation of river terraces

1. receding water after a peak flow
2. change in hydrological regime due to climatic change
3. tectonic uplift of land
4. sea level changes in case of rivers closer to the sea alluvial fans.

1. Found near the foot of the hills
2. The river break into number of channels
3. Low gradient
4. Coarse load is deposited
5. Low gradient
6. Cone shaped deposit
7. Channels shift their position in the plain
8. They are called distributaries
9. Cones are gentle slope in humid areas and drylands they have steep __ slope
